#### Time of Issuance and Scope of Coming Crop Reports

On Wednesday, September 8, 11 a. m. (eastern standard time), the department will issue a report on condition and probable production of cotton.

On Friday, September 10, 3 p. m., reports will be released on preliminary production of timothy hay, apricots, and plums; condition of corn, spring wheat, oats, barley, buckwheat, flax, rice, grain sorghums, hay, clover seed, pasture, dry edible beans, lima beans, soy beans, peanuts, cowpeas, velvet beans, apples, peaches, pears, grapes, oranges, lemons, grapefruit, limes, figs, olives, prunes, almonds, pecans, walnuts, potatoes, sweet potatoes, tobacco, sugar cane, sugar beets, broomcorn, and hops. On Thursday, September 23, 11 a. m., report on condition and probable production of cotton will be issued.

### **Cotton Crop Report for August 1**

A United States cotton crop of 15,621,000 bales (500 pounds gross weight) in 1926 is indicated by the August 1 condition of 69.8% of normal on the 48,898,000 acres in cultivation on

The final outturn of the crop will depend on whether the various influences affecting the crop during the remainder of the season are more or less favorable than usual. If developments during the remainder of the season are as unfavorable to the crop as during 1921, 1922, and 1923, a total production of about 14,425,000 bales might be expected on the estimated acreage. On the other hand, if later developments are as favorable to the crop as during 1924 and 1925, a total produc-tion of about 17,510,000 bales might be expected. Production in 1925 was 16,103,679 bales; in 1924, 13,627,936 bales; in 1923, 10,139,671 bales; in 1922, 9,762,069 bales; and

bales; in 1923, 10,139,671 bales; in 1922, 9,762,069 bales; and in 1921, 7,953,641 bales. Condition on August 1 in 1925 was 65.6% of normal; in 1924, 67.4%; and for the three years 1921–1923, 64%. If the percentage of cotton area abandoned during this scenare chould be equal to the outgoing of the percentage.

season should be equal to the average of the past 10 years, the season should be equal to the average of the past 10 years, the area which would remain to be harvested in the United States this year would be 47,153,000 acres. Upon that acreage the erop of 15,621,000 bales indicated by the August 1 condition would approximate a yield of 158.3 pounds of lint cotton per acre. The yield in 1925 was 167.2 pounds; in 1924, 157.6 pounds; for the five years 1921–1925, 144.2 pounds; and for the 10 years 1916–1925, 153.7 pounds.

Interpolated from July 25 and August 25 reports.
 Not included in California figures, nor in United States total.

Notwithstanding the crop's loss of condition from July 16 to August 1, the decline is less than usual, so that the indicated production shows an increase of about 253,000 bales. The improvement in prospects occurred chiefly during the last week of July, and was due largely to the fact that the number of hoppers decreased and the cotton began squaring and bloom-

ing much more freely. Weather conditions and damage caused by the hopper interfered seriously with the setting of early bolls.

In Texas the number of bolls reported as safe averages about the same as the number reported last year and about half the number reported safe at this time two years ago. Outside of Texas the number of bolls reported as safe averaged only about half as many as were reported safe at this time last year. On the other hand, the plants are in most areas larger than they were last year at this time and throughout most of the belt, except in portions of the Piedmont area of South Carolina and adjoin-ing States, the plants were either blooming freely or were show-ing an increased number of forms on the 1st of August.

Boll weevils are increasing in portions of the Gulf States and Oklahoma, and there is menance of material damage by this insect should rainy weather come during the remainder of the season.

At this time the crop is in a critical stage of its development and fruiting will be materially affected by weather conditions during the next month to six weeks. Almost everywhere throughout the Cotton Belt the crop is reported as being from a week to 10 days late, so that it will need ample time in the fall for maturing.

# Cotton Crop Report as of July 16

A United States cotton crop of 15,368,000 bales (500 pounds gross weight) in 1926 is indicated by the July 16 condition of 70.7% of normal upon the 48,898,000 acres in cultivation on June 25, as estimated by the department.

<sup>1</sup> Interpolated from June 25 and July 25 reports. <sup>2</sup> Not included in California figures nor in United States total.

The final outturn of the crop will depend upon whether the various influences affecting the crop during the remainder of the season are more or less favorable than usual. If develop-ments during the remainder of the season are as unfavorable to the crop as during 1921, 1922, and 1923, a total production of about 13,476,000 bales might be expected on the estimated acreage. On the other hand, if later developments are as favorable to the crop as during 1924 and 1925, a total production

of about 16,628,000 bales might be expected. Production in 1925 was 16,103,679 bales; in 1924, 13,627,936 bales; in 1923, 10,139,671 bales; in 1922, 9,762,069 bales; and in 1921, 7,953,641 bales.

Condition on July 16 in 1925 was 70.4% of normal; in 1924; 68.5%; and for the three years, 1921–1923, 68.1%. If the percentage of cotton area abandonment during this season should be equal to the average of the past 10 years, the area which would remain to be harvested in the United States this year would be 47,153,000 acres. Upon that acreage the crop of 15,368,000 bales indicated by the July 16 condition would approximate a yield of 155.8 pounds of lint cotton per acre. The yield in 1925 was 167.2 pounds; in 1924, 157.6 pounds; for the five years 1921–1925, 144.2 pounds; and for the 10 years, 1916–1925, 153.7 pounds.

The condition of the cotton crop on July 16 represents a decline of 267,000 bales from the forecast based on the condition on June 25.

Nearly all cotton States report recent weather conditions as favorable for plant growth, but as a result of the late start, cool nights, and the loss of the early bloom through the widespread ravages of the cotton hopper much less fruit than usual had set up to July 16. This leaves the crop more exposed than usual to late weevil damage, which may prove a serious menace in a number of States should weather conditions be favorable for the propagation of these insects. The uncertainty of the situation has caused a sharp decline in the reported condition of the crop in the Gulf States. However, there is at present an ample supply of moisture throughout a large portion of the

August, 1926

Cotton Belt, the plants are making rapid growth, and a rapid improvement in prospects might result from weather more favorable for fruiting or for insect control.

It is still too early to calculate the losses to be expected from the boll weevil. On the one hand the rains of Texas, Oklahoma, Louisiana, and Mississippi have permitted the multiplication of this insect and interfered with its poisoning. On the other hand, throughout the Cotton Belt the weevil emerged from hibernation late and in small numbers, and in some large areas of Tennessee and the Southeast dry weather has lessened the weevil menace.

The weevil is reported to be less numerous than it was last year in North Carolina, South Carolina, Georgia, and Alabama, and somewhat more numerous in Mississippi, Louisiana, and Oklahoma, while apparently averaging about the same in Texas and Arkansas.

The hopper has become a real menace to the cotton crop this year throughout all but the northern edge of the belt. It is chiefly responsible for the reduction of the average cendition of the crop in the Gulf States. In Texas, hopper damage has extended over 90% of the cotton-growing area, but this insect is now reported to be disappearing from many localities in the southern, central, and eastern districts, and young plants there are beginning to bloom freely.

### Intentions to sow Winter Wheat and Rye

#### August 1, 1926

Wheat.—The farmers of the United States are intending to sow an acreage of winter wheat this fall 14.4% greater than sown last fall, according to reports received about August 1 by the department from about 40,000 farmers. If these intentions are carried out a total area of 45,064,000 acres will be sown. This acreage would be greater than the acreage of any year except the years of 1918, 1920, 1921, and 1922. Although the acreage reported as intended to be sown is

Although the acreage reported as intended to be sown is 14.4% greater than the revised estimate of the area actually sown last fall it is only about 4% greater than the area which farmers intended to sow last fall and which they probably would have sown if weather conditions had permitted Present intentions are above intentions as reported a year ago in most regions, except in the drought-stricken area of South Dakota, Minnesota, and Montana. Last year farmers in the United States intended to increase sowings 9.7\% over 1924. Actual sowings were 0.3\% less than sowings in 1924. In both 1923 and 1924 the reported intentions agreed within 3% with the December reports on the acreage sown.

December reports on the acreage sown. This report is not a forecast of the acreage that will be planted, but merely a statement of farmers' intentions as of August 1. It is published in order that growers may modify their plans if a change appears desirable. A departure of actual sowings this season from present intentions is to be expected if weather conditions should prove unusual, or if there is any material change in the price outlook. Intended plantings may also be affected by this report.

#### Intended Sowings, Winter Wheat, Fall 1926

[Expressed as percentage of estimated actual showings in years shown below]

State •	As per cent of fall sow- ings, 1909-1913	As per eent of fall sow- ings, 1914–1918	As per eent of fall sow- ings, 1919–1923	As per cent of fall sow- ings, 1924	As per cent of fall sow- ings, 1925
Pennsylvania		85 102 96 97 111 96 72 102 127 83 64 64 113 64 62 232 232 137 141 145 74 4 104.9	93 92 113 187 106 98 77 91 107 97 97 97 90 90 90 120 124 722 104 114 91 111 99 9100.9	106 110 120 118 122 131 126 109 111 119 169 119 19 19 9 5 122 114.0	$\begin{array}{c} 101\\ 122\\ 134\\ 127\\ 104\\ 145\\ 160\\ 108\\ 164\\ 104\\ 108\\ 115\\ 112\\ 105\\ 112\\ 105\\ 108\\ 120\\ 146\\ 106\\ 121\\ 114, 4\end{array}$

The area which farmers intend to sow this fall is 34% greater than the prewar (1909–1913) average annual fall sowing of 33,594,000 acres; it is about 5% more than the average annual fall sowing of 42,929,000 acres during the years 1914-1918; and about 1% more than the average annual fall sowing of 44,634,000 acres for the years 1919-1923.

The average annual abandonment of winter-wheat acreage for the past 10 years has been 12.8%; the reduction in acreage due to abandonment ranging from 2% to 29%. If the average annual abandonment should occur this winter, it would leave from the intended sowings about 39,274,000 acres to be harvested next summer, compared with 36,700,000 acres of winter wheat left for harvest this year, an increase of 7%.

wheat left for harvest this year, an increase of 7%. Various factors account for the intended increase in the acreage to be sown to winter wheat. In many States returns from winter wheat were relatively high compared with those from competing crops in both 1924 and 1925. In northern Missouri and neighboring sections of Kansas and Iowa, and in a large area east of the Mississippi River the increase is in part due to the fact that last fall wet weather followed by early freezes prevented many farmers from sowing their usual acreage. In the northern and eastern States many farmers are also planning to seed an increased acreage of grass with winter grain this fall because during the last two seasons much of the area of grass seeded with spring grain failed on account of drought. In some States where winter wheat can be pastured the present acute shortage of pasturage may account to some extent for the intentions to increase the seeding of wheat this fall. In the western portion of the Great Plains wheat territory some of the intended increase this season will be on newly broken land. In the Pacific Coast States dry weather restricted the sowing of wheat last fall and the planting of the intended acreage is largely dependent on moisture conditions at planting time.

Rye.—An increase of 17.4% in the acreage intended to be sown to rye over the area sown last year is reported by farmers on August 1. The reported increases are moderate in the more important rye States; 5% in North Dakota and from 10% to 12% in Michigan, Wisconsin, and Minnesota. Last year, however, intentions in the ten important rye States were about 38% above the actual area sown. This was due in large part to adverse weather in the fall. Two years ago intentions in these States were about 3% above the actual area sown; three years ago they were about 1% below. The acreage of rye for harvest in 1926 was 3,601,000 acres, compared with 4,088,000 acres in 1925 and a five-year average from 1920–1924 of 4,960,000 acres. The value of rye for fall and winter pasture and as a nurse crop for seeding grass and clover, the improved price during recent months, and the heavy reduction in acreage for several years past, are factors favoring the sowing of an increased area this fall.

The price of unwashed wool to producers was 31.9 cents per pound on July 15 as an average for the United States. This is the lowest price on July 15 since 1921, when the price of 15 cents was nominal, at about the lowest point of the "deflation." Last year on July 15, the price was 39.4 cents per pound.

### **Tobacco Summary for August 1**

The outlook for tobacco production in 1926, while still below the average for the past five years, is better than it was one month ago. The average condition on August 1 was 75% of normal, or more than 4 points below the 10-year average for that date. The indicated total production, based on August 1 conditions, is 1,202,884,000 pounds, compared with 1,139,251,000 pounds indicated on July 1

The States important in the production of eigar leaf all show improvement. In the Connecticut Valley, 77% condition is reported for sun-grown and 79% for shade. An increase of more than 5,000,000 pounds in production compared with the outlook on July 1 is indicated.

Conditions in Pennsylvania are 86%, the same as the 10-year average, which is a slight improvement over last month. Hail damage occurred in Lancaster County during the month.

Severe drought conditions in the Wisconsin northern district were relieved by rains late in July. A condition of 79% is reported for this section. In the southern district of Wisconsin the condition is 90%. The State average is 85%, compared

In the Miami Valley the condition is reported at approxi-mately 70% of normal compared with 86% last year. A late season and poor stand have lowered conditions.

In the principal Bright flue-cured sections moderate gains are shown. North Carolina, South Carolina, and Georgia have prospective production of this class amounting to about 400,000,000 pounds, compared with about 382,000,000 pounds indicated by July 1 conditions and 493,000,000 pounds produced in the same territory in 1925. The Georgia and Florida crops are already being sold, and the quality and price are reported much more satisfactory than last year. Improvement in the crop since July is noted in South Carolina. In North Carolina tobacco received a setback late in July, but conditions improved around the close of the month.

Maryland Export shows some improvement over a month ago, due to gains in July. The condition figure is 83%, compared with 79%, the 10-year average. Tobacco worms are reported unusually bad in Prince Georges County.

#### CONDITION REPORT BY TYPES

While it is too early to forecast production by types in States where several types are grown, the following condition figures are given:

Burley .-- The average condition over the whole district on August 1 was 76.4% of normal. The condition of this type in Kentucky was reported as 77%, compared with 75% on August 1, 1925, and 81.7%, the five-year average. In Tennessee, where Burley is undergoing expansion, a condition of 75% was reported, compared with 58% a year ago, and 77.2%, the fiveyear average.

One Sucker.—A general average of 71.5% is reported. The averages in Kentucky and Tennessee are 74% and 75%, respectively, compared with 73% and 67% last year, and 70.6% and 70.4%, the five-year averages. A condition of 47% in the Dark counties of Indiana is responsible for lowering the general

average for this type. Green River.—The Owensboro district shows an average of 66%, compared with 82% last year, and 70.6%, the five-year average.

Henderson Stemming .- The Henderson district, comprising both air-cured and fire-cured types, shows 61%; 1925, 71%; five-year average, 74.4%.

Paducak.—The averages for Kentucky and Tennessee are 65% and 68% respectively, with a general average of 65.6%, compared with 83% for Kentucky and 70% in Tennessee one year.ago. The five-year average for this type is about 73%. Clarksville and Hopkinsville.—The conditions in the eastern

Clarksville and Hopkinsville.— The conditions in the eastern dark-fired district are decidedly better than in the western (Paducab) area; 85% for Kentucky and 83% for Tennessee are reported, compared with 79% and 78% respectively, on August 1, 1925. The five-year averages for the Kentucky and Tennessee portions of the eastern district are 69% and 73.6%, respectively

Virginia Dark shows 71%, compared with a figure between 50% and 51% last year and 66.3%, the five-year average.

Virginia Sun-cured .- A condition of 80% is shown, compared with 47% a year ago and 64%, the five-year average.

The uncertainties of tobacco production were well illustrated by Virginia Dark and Sun-eured last year. On August 1, 1925, a condition of 50% to 51% was reported for Dark and 47% for Sun. By the close of the season, however, both had made such a recovery as to make them unusually profitable.

### General Crop Conditions August 1, by States and Crops

The composite condition of all crops in the United States on August 1 was 95.8. This indicates that crops were 4.2% below their 10-year average condition on that date. This composite condition is 2.2 above the corresponding composite on July 1 and 3.8 lower than the composite of per acre yields last year. This year's total acreage in 21 cultivated crops is about 2% above that harvested last year. The 10-year average con-dition (not normal) is the base, 100.

<sup>1</sup> Indications of total production shown are computed from the estimated acreage multiplied by the yield per acre indicated by conditions on the date stated. The final outturn may be higher or lower than present conditions indicate according as future developments prove more or less favorable to the crop than usual. <sup>2</sup> Revised.

<sup>3</sup>.Preliminary estimate.

<sup>4</sup> Arceage in cultivation, June, 25.
<sup>5</sup> 4-year average, 1922–1925.
<sup>6</sup> Production in thousands, not millions, and yield in pounds.

Nore.-Cooperation in crop reporting is maintained by the United States Department of Agriculture with the State boards of agriculture, or other State agencies as the case may be, of many States, thus improving the accuracy of the reports and avoiding the confusion of a duplication of reports. Cooperation exists in the New England States, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, Kansas, Virginia, West Virginia, North Carolina, Georgia, Alabama, Arkansas, Montana, Colorado, Utáh, and California.

### Comments to Accompany Crop Report as of August 1

A general improvement in prospects for nearly all crops except corn, oats, and hay occurred during July, chiefly as a result of somewhat better moisture conditions in the latter part of themonth. On August 1 the composite condition of all crops was 4.2% below the 10-year average condition of crops on that date. This represents an improvement of 2.2%-since July 1. When allowance is made for the upward trend in the yield per acre of several important crops, the present outlook is for yields 2.8% below the average during the last 10 years. Corn.—The condition of the corn crop on August 1 was 72.5%, which is much below the 10-year average of 80.5%. The present

condition indicates a crop of 2,576,936,000 bushels, which would be 328,000,000 bushels, or about 12%, below the crop of last year, and 272,000,000 bushels below the average during the five years 1921-1925.

The present forecast of the corn crop is \$4,000,000 bushels less than the forecast of July 1. The decline resulted from drought, high temperatures, and hot winds in Nebraska, Iowa, Kansas, Missouri, and the Dakotas, where prospects decline by 166,000,000 bushels. The greatest decline occurred in Nalsas, thisothi, the second bushels. The greatest decline occurred in Nebraska, where prospective production decreased 76,000,000 bushels during July. Small declines also took place in a number of southern and western States. Elsewhere corn prospects have improved because of beneficial rains in the latter part of July. The greatest improvement took place in Texas and Okla-homa, where the August 1 indication is 50,000,000 bushels

greater than on July 1. Winter wheat.—The preliminary estimate of the production of winter wheat is 626,482,000 bushels, compared with last year's crop of 396,000,000 bushels and the average of 549,000,000 bushels for the five-year period 1921-1925.

The size of the production of this year is due partly to an increase of 18.7% in the acreage over 1925 and partly to the high average yield of 17.1 bushels per acre. This yield has not been equaled since 1914. It compares with 12.8 bushels for the winter wheat crop of 1925 and the five-year average of 14.2 hugh her the strength of 1925 and the five-year average of the strength of the strength of 1925 and the five-year average of the strength of the stren 14.3 bushels. In practically all States the estimated yield The grain filled well in spite of dry weather because of cool temperatures during time of maturity. Threshing returns are generally exceeding yields expected at time of harvest. The quality of winter wheat is higher than for many years.

It is reported as 94.5% of a high medium grade, compared with 90.4% last year and a 10-year average of 89.9%.

Spring wheat — A spring wheat production of 212,719,000bushels is indicated by the condition of 60.2%, a gain of 13,000,000 bushels over the July 1 indication. Of the spring wheat total, a Durum crop of 48,459,000 bushels is indicated for Misrogeta North Debate for Minnesota, North Dakota, South Dakota, and Montana. In spite of an increase in Durum acreage this year of 15%above that of last year, the effects of drought have so limited the production that it is much below the 68,000,000 bushels of last year and the five-year average of 66,000,000 bushels.

Winter and spring wheat combined make a total wheat crop of \$39,201,000 bushels, compared with last year's crop of 665,000,000 bushels and a five-year average of \$02,000,000 bushels.

Oats .- The indicated oat crop of 1,311,159,000 bushels is hearly as large as the five-year average crop of 1,327,000,900 bushels but much below the large production of 1,512,000,000 bushels last year. The crop this year has contended in various areas with drought, hot winds, late sowing, and rust, and present reports indicate a yield of only 28.5 bushels per acre. <sup>1</sup> Yield per acre	e.																				

#### (Continued from page 237)

This would be the second lowest yield in 15 years. On account of the failure of grain to mature in some sections, an unusual proportion of the crop has been harvested for hay. Short straw is commonly reported. The stocks of oats on farms on August 1 amounted to 109,933,000 bushels, an unusually large quantity made possible by the large crop of last year. This amount of farm stocks on August 1 has been exceeded in only

amount of farm scores on August 1 has been exceeded in only-two years—1916 and 1921. Barley.—The condition of barley, 69.8%, is the lowest August condition reported since 1911. The Minnesota condi-tion is 8 points below the 10-year average, North Dakota 19 points, and South Dakota 48 points. The indicated barley pro-duction is 101.085.000 hughels compared with last year's group bolits, and bolten backta a points. The indicated spin spin of 217,497,000 bushels. It is estimated that 4.5%, or 9,873,000 bushels, of last year's barley was still on farms August 1. This compares with stocks of 5,627,000 bushels, or 3.2%, of the 1024 production in the comparison in the comparison in August 1. the 1924 production in the same position August 1, 1925.

Rye .- The preliminary estimate of rye production at 41,-870,000 bushels compares with last year's crop of 48,612,000 bushels and with 68,153,000 bushels for the five-year average from 1921–1925. The estimated average yield of 11.6 bushels per acre is the lowest recorded in the last 22 years, and is due mainly to drought in the important way producing areas of the per acre is the lowest recorded in the last 22 years, and is due mainly to drought in the important rye-producing areas of the Dakotas. This yield is, however, 0.6 of a bushel larger than was forecast last month, due to larger threshing returns in most of the important rye-producing States. The quality of this year's rye is 87.4%, which is 1 point higher than last year but 3 points lower than the 10-year average. Flaxseed.—The condition of flax on August 1 was 65.2%of normal, compared with 73% on July 1. This indicates a crop of about 19,000,000 bushels. Last year's crop was 22,000,000 bushels and the five-year average less than 18,000-000 bushels. The decline of about 1,000,000 bushels in outlook

2000 bushels. The decline of about 1,000,000 bushels in outlook since July 1 is due to adverse weather conditions in the Dakotas and Montana.

#### Estimated Crop Conditions August 1, 1926, with Comparisons-Continued

Rice .- The condition of the rice crop in the United States en August 1, namely, 86.2% of normal, indicates a crop of 40,543,000 bushels, against a forecast production on July 1 of **39**,663,000 bushels and an estimated production last year of **34**,259,000 bushels. The outlook, therefore, is for a crop more than 6,000,000 bushels in excess of last year. Condition has improved during the last month in Missouri, Arkansas, and Texas and declined somewhat in Louisiana and California. The condition of the crop on August 1 was slightly below the 10-year average, and the indicated yield per acre as of August 1 is 39.8 bushels, against a 10-year average yield per acre of 39 bushels.

Grain sorghums.—The average condition of grain sorghums for all States is 86.4% on August 1, indicating a probable production of 102,210,000 bushels. This is 31,160,000 bushels more than was produced last year and is an improvement of about 8,000,000 bushels over the July 1 outlook. Of the im-portant grain sorghum States, Texas, Oklahoma, and New Mexico show much better condition than a year ago. The Kansas crop is rated about the same as last year.

Hay.-On account of the widespread drought during the early part of the season, this year's hay crop is expected to be only about 88,000,000 tons. This would be 12% smaller than last year's hay crop and smaller than that of any previous year since 1913.

The crop of tame hay indicated by August 1 condition is 78,000,000 tons, compared with 87,000,000 tons produced last year and 98,000,000 tons in 1924.

The crop of wild hav is also short. The condition indicates a production of about 10,000,000 tons, compared with last year's crop of 13,000,000 tons and the 1924 crop of 15,000,000 tons.

Timothy and mixed timothy and clover hay improved during July in all States except in the Great Plains States from Oklahome northward. The yield of the first cutting of clover hay was 1.09 tons per acre, which is better than the first cutting of 1.03 tons per acre in 1925. Yield of clover hay for all cuttings last year was 1.35 tons per acre.

In the irrigated sections of the West, alfalfa will produce about an average crop this year, but in the best alfalfa sections of Kansas, Nebraska, and South Dakota the yield has been materially cut by dought.

Pastures continue to show very low condition in all of the Atlantic and North Central States. In the Southwestern States farm pastures as a rule are good. In the Western States the lower ranges are dry but higher ranges are furnishing ample grazing for livestock on the range. For the country as a whole the condition of farm pastures is lower than in any previous August since 1911 except in 1925.

Edible beans .- The condition of edible beans on August 1 was 81.5% of normal at that date, giving indication of a crop of about 18,987,000 bushels, which is about 400,000 bushels more than indicated by the condition of July 1, but about 500,000 bushels less than the estimated production of last year, which was the largest on record. The improved prospects were in the Eastern States, principally Michigan, most of the Western States showing small declines.

<sup>1</sup> Condition of fate crop.
 <sup>2</sup> Production of early and late crops combined. Includes 19,725,000 hushels of early potatoes and 4,381,000 bushels of late potatoes in States marked.
 <sup>3</sup> Includes allowanees for condition at harvest of the early southern crop.

#### (Continued from page 239)

Peanuts.—The peanut crop improved greatly during July, and the condition of 76.7% on August 1 indicates a crop of about than indicated by the condition on July 1 but is still about 22,000,000 pounds, which is about 28,000,000 pounds greater than indicated by the condition on July 1 but is still about 42,000,000 pounds less than the crop realized last year. The final production will depend partly on the character of the season after August 1 and partly on the proportion of the crop gathered this year for the nuts.

Fruits.—Fruit prospects this season may be summarized as uniformly good. The only important exceptions are California prunes and olives. The apple crop, estimated at 218,920,000 bushels, is expected to be the largest crop settinated at 218,920,000 bushels, is expected to be the largest crop since 1920, and seems to be of fine quality. The peach crop is estimated at 63,619,000 bushels, exceeding all records since 1915. The pear crop of 25,074,000 bushels and the grape crop of 2,444,000 tons will break all records. Oranges, grapefruit, and lemons will all give big crops. Potatoes — During Univ prospects for potatoes improved in

Potatoes.—During July prospects for potatoes improved in nearly all of the Eastern States, especially in Maine and Wis-

consin, but declined slightly in the Dakotas and in some States farther west. The crop is now estimated at 345,569,000 bushels. This would be about 20,000,000 bushels more than the very Short crop of last year but 80,000,000 bushels less than the very large crop of 1924. For the country as a whole prospects im-proved during July by about 12,000,000 bushels, or between 3% and 4%. The yield in the principal late potato States will depend largely on weather conditions during the remainder of the season, but because of improved methods of culture and the increased proportion of the acreage in the high yielding States present indications point to a yield somewhat above the average

of the last five years. Sweet potatoes.—With more liberal rainfall, prospects for sweet potatoes show marked improvement in all producing areas except California. Although the condition of the crop is still uniformly low, the yield should exceed the exceptionally low yields secured during the last two years. The crop is now estimated at 73,140,000 bushels, which would be 11,000,000 bushels more than were harvested last year.

**Tobacco.**—Tobacco conditions improved during July. On July 1 the condition of the crop was 73.1% of normal, compared with 82.2%, the 10-year average for that date. On August 1 the condition was 75%, compared with 79.2%, the 10-year average. This improvement represents an increase in pros-pective production of roughly 64,000,000 pounds, the total indicated production based on August 1 conditions being 1,202,884,000 pounds. In the porthern district of Wisconsin late rains have improved

In the northern district of Wisconsin late rains have improved conditions, where the drought had been severe, and also in the Connecticut Valley, Virginia, the Carolinas, Kentucky, and Tennessee. Despite hail damage in Lancaster County, the

Pennessee. Despite nail damage in Lancaster County, the Pennsylvania crop in general promises well. Sugar cane.—The crop as a whole declined slightly in con-dition during July and fell off rather sharply in Louisiana where the decline amounted to 5%. In this State condition is very unpromising at this time due to an unsatisfactory stand and the presence of mosaic disease, root rot, sugar cane moth borer, etc. The cane also is nearly five weeks late and under-sized. The outlook is now for a crop of less than 132,000 short tops of sugar cane tons of sugar cane.

Sugar beets.—The sugar beet crop in the United States has declined slightly during July and stood at 85.3% of normal on August 1, against 86.3% on July 1 of this year and a 10-year average July condition of 86%. The condition figure is higher in Ohio, Michigan, Wisconsin, Idaho, and Colorado and lower in Nebraska and Utah. In Utah condition fell off of the in Lub, due to the program of the lack happene or white 26 points in July, due to the ravages of the leaf condition left of fly. The condition of the crop as a whole on August 1 indicates an average yield per acre of 8.71 short tons, against 11.37 short tons in 1925 and a total production of 6,654,000 short tons of sugar beets against a production last year 7,423,000 short tons. On the basis of average outturn, 865,000 short tons of beet sugar may be expected from this crop.

Egg production so far this year is running ahead of last year during the same months for the same number of laying hens. On account of a milder winter, the January production this year was 49% more than it was last year, February 21% more,

and March 8% more. But a cold April reduced the layings 2%below last year in April. . There was a substantial increase in following months.

#### Acreage of Peppermint and Production and Foreign Trade of Peppermint Oil

A total of 51,400 acres of peppermint for harvest in Indiana and Michigan this year compared with 25,390 acres last year and Michigan this year compared with 25,390 acres last year for the two States is indicated by the answers to the August 1 inquiry. Apparently much acreage considered worthless early last year was later harvested. The total plantings of pepper-mint this year exceeded those of 1925 by 2%. This year, however, nearly 90% of the crop will reach harvest, whereas less than 50% of the planted acreage survived a year ago. The condition figure reported in Indiana, August 1, was 63% of normal this year and 53% last year. This reflects the degree of thriftiness of the plant growth but does not neces-sarily imply the same difference in yield. The proportion of new

<sup>1</sup> Spearmint not included. <sup>2</sup> The east Indiana district includes La Grange, Noble, and Steuben Counties; the central Indiana district is Elkhart, Kosciusko, and Whitley Counties; the west district includes the other mint growing counties. The division was made on the similarity of losser last Yang. on the similarity of losses last year.

mint is much larger than last year and this changes the relation of yield to the condition figure. A record of condition figures with the yields that followed for several years would be needed to interpret the condition figure in terms of yield of oil. Since on the 1926 distilling returns to date, say they are light. In 1925 the average yield of oil as reported to the department

was 13.3 pounds per acre harvested in Indiana and 11.2 pounds per acre harvested in Michigan. This would indicate a pro-duction of peppermint oil in 1925 of 273,000 pounds in Indiana and 56,000 in Michigan, or a total of 329,000 pounds. No reports of distillers are available as a check.

In addition to the acreage in Indiana and Michigan, newspaper accounts indicate around 3,000 acres in Washington and probably the harvested acreage will be considerably below the planted.

### Wool Shorn, 1925 and 1926

The estimated amount of wool shorn and to be shorn in the United States in 1926 is 15,147,000 pounds larger than the amount shorn in 1925, according to the preliminary estimate of the department. The total estimated production in 1926 is 269,054,000 pounds and in 1925 it was 253,907,000 pounds; the average weight per fleece is 7.8 pounds in each year.

The accompanying table shows the estimated production and weight per fleece by States. The production and weight per fleece in 1925 in States for which the 1925 agricultural census figures have been published by the Bureau of the Census, have been revised on the basis of the census information. For other States the figures are those published by the department in January, 1926.

In January, 1927, the estimates of the number of sheep shorn, the weight per fleece and wool production for the years 1920 to 1926 will be revised for all States on the basis of the census information. These revisions will make some changes in total yearly production, but increases or decreases from year to year during the period are not expected to show much change from the present figures.

the present ngures.

<sup>1</sup> No recent information. The acreage shown is that which was originally reported as intended to be planted.
<sup>1</sup> Not reported. Acreage assumed to be the same as in 1925.

Of the 1925 tobacco crop of 1,374,400,000 pounds, 86% of the production in pounds was of types other than cigar. Of the total crop, 42% was flue cured, partly composed of cigarette tobacco, 15% was fire cured, and 29% was air cured, also partly cigarette tobacco.

.

The estimates of hay acreage for 1924 and 1925, and the preliminary estimate for 1926 indicate that the alfalfa acreage is gradually becoming a larger part of the entire hay acreage. In 1924, it was a little under 18% of the entire acreage, in 1925 it was a little above 18%, and in 1926 the preliminary estimate was 19%.

### Lamb Survey, July, 1926-

An increase of about 2,200,000 head, or 10%, in the size of the 1926 lamb crop over that of 1925 is shown by the lamb survey made by the department. This increase is due to an increase of 2,350,000 head, or 16%, in the crop of the western lamb States. The crop in the native sheep States is about 138,000 head, or 2% smaller than that of 1925.

The smaller size of the native lamb crop this year was due to the reduced percentage of lambs saved, since the estimated number of breeding ewes January 1, 1926, was 3% larger than January 1, 1925. The large increase in the Western States was due both to an increased number of breeding ewes, over 5%, and a ratio of lambs saved to breeding ewes of 88 this year compared with 79 last year. While all Western States showed an increased ratio of lambs saved, the most notable increases were in the Southwestern States. It is probable that the ratio of lambs saved in the west is the largest for the whole area on record and that the lamb crop was one of the largest in actual numbers.

The number of ewe lambs being kept for breeding ewes on January 1, 1926, is shown to be about 5,750,000 head. This number is 21% of the number of breeding ewes over 1 year old at that date. In the native States the percentage is 19 and in the western 22. The percentages are more than sufficient for ordinary replacement of breeding ewes and indicate a continued tendency to expand breeding flocks.

The computed lamb crops cover, in the native States, lambs It is a solution of the second cerning lamb losses after June 1, or after docking, until final disposal, the total number of lambs finally slaughtered or added to sheep numbers from the 1925 crop or to be so disposed of from the 1926 crop can not be determined.

This is the first time the department has reported the size of the lamb crop in numbers. The only fairly comparable census figures of lamb crops are those of 1900, which showed as of June 1, 21,651,000 lambs and 31,858,000 ewes of all ages. The estimated total breeding ewes and ewe lambs kept for breeding ewes January 1, 1926, were 31,872,000, and the lamb saved, which includes many lambs already marketed, were 24,519,000.

The lamb crops of each year by States for the more important States are shown in the accompanying table, together with the estimated number of breeding ewes over 1 year of age January 1 each year, and the ratio of lambs saved to such breeding ewes as determined from the reports of producers in each State. In the native sheep States the reports used were secured through the rural mail carriers of the Post Office Department. In the Western States these were supplemented by reports made by large operators to the State statisticians of the Department of Agriculture. For the native States the ratio of lambs saved each year shown in the table is as computed from the returns secured. For the Western States the ratio was estimated from all available evidence.

<sup>1</sup> Lambs saved defined as lambs living June 1 or sold before June 1 in native States and as lambs marked or branded in Western States. <sup>2</sup> Computed by multiplying ewes over 1 year, January 1, by ratio of ewe lambs to

ewes over 1 year.

<sup>3</sup> Excluding South Dakota. <sup>4</sup> Excluding Texas.

### Sheep and Wool Outlook

The sheep industry in this country is on the increasing side of the production cycle. A 10% increase in the 1926 lamb crop is indicated by the lamb survey, but with the present demand outlook, lamb prices during the next 12 months may average only slightly lower than during the last 12. While prices for wool may continue near their present levels for some time, there are no present indications of a return to the high prices of the end of 1924.

#### LAMBS

The lamb crop of 1926 is indicated as 10% larger than that of 1925 by the lamb survey.

Supply situation.—Results of the 1926 lamb survey indicate a considerable increase in the total supply of lambs to be sold during the last half of 1926 over the same period last year or any year since 1921. How much this increase will affect supplies at central markets depends on the local demands in the West for ewe lambs for breeding and the movement of feeding lambs direct to feed lots.

Few contracts have been made to date for feeder lambs in Colorado and western Nebraska, where the greater part of direct shipments go, but feed prospects are quite promising and from this standpoint the feeder demand from these areas should be larger than last year. Present crop conditions in the Corn Belt, while below this date a year ago, indicate no shortage of feeds that should curtail demand for feeding lambs. Hog supplies are indicated as no larger than last year and a decrease in available supplies of feeding cattle is not unlikely.

Because of the continued drought over a large area west of the Continental Divide range feed prospects for the coming winter are much below last year, and this may result in a much closer marketing of lambs and culling of old ewes than last year, when feed supplies were plentiful and the local demand for breeding stock was keen. In most range areas east of the Divide present conditions promise abundant feed supplies for the coming winter and no forced marketings on account of lack of feed are anticipated.

Supples of slaughter lambs for the next half-year will be larger than for the corresponding period last year. For the crop year June 1, 1926, to May 31, 1927, lamb slaughter will probably be materially larger than for the crop year ended May 31, 1926. The slaughter from now until December 1 will depend to considerable extent upon the feeder demand, as many western lambs go either for slaughter or for feeding according to whether killers or feeders will pay the most for them. With a large supply of feeders it seems likely that heavy weight feeding lambs will be discriminated against and many of this kind that were bought by feeder buyers last fall will go to killers this year.

Demand Situation.—Consumers' demand for dressed lamb during the first half of 1926 continued at the same high level that characterized 1925. This is ascribed to the high prices for most other meats and active business conditions. Increased quantities of lamb were consumed at dressed prices averaging only slightly below those of last year. On the other hand, the price of live lambs averaged about \$1.50 below last year, due largely to the lower pelt values. Although employment has been good and payrolls main-

Although employment has been good and payrolls maintained at high levels, general industrial activity has shown a slight tendency to slacken since March. While it is possible that there will be only a moderate mid-year recession in business activity such as characterized the last two years, the fact that there has been a concurrent weakness in the wholesale price level makes it seem probable that during the next 12 months there may be some reduction from the high level of the last 18 months.

Lamb Price Outlook.—Factors that may influence prices for the 1926 lamb crop unfavorably are the indicated increase of 10% in the size of the crop, a probable downward tendency in hog prices next spring, and a possible slackening in business activity. Favorable factors are the prospective reduction in cattle slaughter for the next 12 months, and high hog prices through 1926. If the indicated increase in the lamb crop results in a 10% increase in lamb slaughter, a 6%-10% reduction in the average price of slaughter lambs for the next 12 months below the average of the last 12 months would not be unexpected with the present demand outlook. However, the movement of slaughter lamb prices from month to month, as in the past, will depend largely upon the extent to which the marketings are concentrated in individual months.

#### WOOL

Prices of wool at London, which had been declining since 1924, have become steadier, and for the past few months prices for the finer grades have been fairly stable.

In 1925 world wool production, as estimated by the Department of Commerce, was about 2% larger than in 1924, but stocks both in producing and in consuming countries are generally reported to be lower on June 30 than a year ago. The total number of sheep in 16 countries reporting at the beginning or in the summer of 1925 was 5% larger than in 1924 and 7% larger than in 1923. The number in these countries in 1925, however, was still 7% below pre-war. With present unfavorable weather conditions in Australia and other Southern Hemisphere countries, there are no indications that the 1926 wool production will be any larger than in 1925.

In France, where wool manufacturing activity has been high, stabilization of the currency would probably tend to reduce demand temporarily. In Germany mill consumption may be expected to continue to increase. In the United Kingdom, where the coal strike has impeded the textile industry, a settlement of the strike would probably tend to increase demand for wool. There is nothing in the foreign situation to indicate any material change from present levels in London prices during the next few months.

Wool prices in the United States, after strengthening somewhat during the last quarter of 1925, dropped materially in the early part of 1926. In June average Boston prices for various grades of grease wool ranged from  $4\notin$  to  $8\notin$  below those of a year previous. Domestic wool prices at present are materially below London prices plus the tariff differential.

Domestic wool manufacturing, which showed some increase in activity in late 1925, dropped off in the early months of 1926 until in May it was nearly as low as in the middle of 1924, the lowest point for three years. Recent reports, however, indicate some increase in activity in June.

While domestic stocks of wool are somewhat larger than a year ago, they are not burdensome. The 1926 wool clip in this country was about 5% greater than in 1925, but domestic production has only a slight effect upon domestic wool prices; world wool prices, the level of domestic demand, and the rate of wool consumption ordinarily are much more important factors in the demestic price. General business activity in the United States has been at an unusually high level during the past 18 months. There are no indications of an immediate improvement in demand for wool in this country outside of the fact that manufacturing activity is abnormally low and that the recent check in the decline in wool prices is apparently encouraging more confidence.

Domestic prices are so low in relation to London prices that it is not likely they would be unfavorably affected by minor changes in world prices. Any increase in mill takings in this country would probably strengthen domestic prices. While wool prices may continue near their present levels for some time, there are no present indications of a return to the high prices of the end of 1924.

### Western Livestock and Range Report, August 1

Ranges in Western States declined in condition during July as a result of hot dry weather prevailing in many States, and the condition of livestoek is slightly lower than a month ago, according to the monthly range and livestock report issued by the department.

Ranges.—In the east slope and plains country range conditions are generally good, but with dry spots in eastern Montana, western Dakotas, northeast Wyoming, eastern Colorado, and western Kansas and Nebraska. Rains have relieved conditions in localities, while in Texas, Oklahoma, and New Mexico, rains have been general, and conditions on the whole in these States are very satisfactory. Range conditions are mostly excellent in the mountain country of Montana, Wyoming, and Colorado.

The Northwest States and the intermountain area have suffered from continued dry weather where in many sections stock water is becoming short, feed is curing early, and lower ranges burning badly. However, in most of this area range feed has been plentiful to date, but prospects for feed the remainder of the scason and on into fall and winter are not good. Extensive forest, brush, and grass fires have added to the difficulty, and destroyed considerable good range. California is rather dry, but ranges furnish good feed. Arizona range conditions are mostly favorable, following well-distributed summer rains.

Cattle.—Cattle and calves arc generally in excellent eondition, with a few exceptions noted in the localities hit hardest by drought. In the dry areas cattle are not expected to make normal gains from now on. There has been some movement to markets and to other sections from districts suffering from drought and it seens probable that numerous localities will find it necessary to ship from the dry ranges a little earlier than normally. But this may be balanced by later shipments from States like Wyoming, Colorado, and the Southwest, where feed is exceptionally good. Present prices for range eattle are not encouraging, and little is reported in the way of local sales.

Sheep.—Sheep and lambs continue to show excellent condition so far. They have been affected but little by dry hot weather, except that lambs are lighter than last year and are showing a smaller fat end. In Texas, New Mexico, Arizona, and Colorado, lambs are expected to be better than last year, while in Wyoming they are very good, and in Montana mostly good. Drying ranges have forced early and rapid market movement of lambs from Idaho and Nevada, and this tendency is likely to become more widespread during the next six weeks. Contracting lambs for fall delivery took on new life in some sections, particularly in Nevada and Utah, where large numbers have been sold recently at reported prices averaging around 10 cents per pound off ranges.

### Livestock and Meat Situation

Cattle slaughter under Federal inspection in June this year exceeded that of the corresponding period of 1925 by 120,229 head, calves showed a gain of 6,786 head, and sheep and lambs 81,565 head, but hog slaughter was 301,993 head less. For the first six months of the eurrent year the combined eattle and calf slaughter was larger than for any corresponding period on record, and that of cattle alone, exclusive of ealves, the second largest.

Average live and dressed weights of all species for the month were above those of June, 1925. An increase of 16.41 pounds per head in the average dressed weights of eattle, together with the increased numbers slaughtered, resulted in a gain of 75,156,024 pounds in the total dressed weight. In the case of calves the gain amounted to 2,686,945 pounds, and in sheep and lambs 3,400,710 pounds. While the total dressed weight of hogs was 3,681,821 pounds under the June, 1925, figure, the gain of 14.27 pounds in the average dressed weight offset to a considerable extent the decrease in numbers slaughtered.

Exports of meats and meat products generally were smaller in June this year than last, although those of cured beef were 356,046 pounds heavier, and oleo oil and stearin showed a gain of 1,370,670 pounds. Among the more important exports which showed decreases were cured pork, 15,528,803 pounds, lard 3,577.693 pounds, and beef tallow 1,032,496 pounds.

As a general rule, prices of livestock and meats averaged higher than in June last year, although good grade steers at Chicago averaged \$1.21 lowcr and beef of the same grade at eastern markets 26¢ per 100 pounds lower, lard 12¢ lower, and sheep \$1.49 lower. Veal calves averaged \$2.22 higher, hogs \$1.85 higher, and live lambs 77¢ higher. Veal carcasses were \$2.99 higher, dressed lamb \$3.65, and mutton \$1.17. With the exception of lard, prices of fresh and cured pork showed substantial gains. Loins averaged \$5.84 higher, picnics \$5.02, bacon \$4.18, and hams \$9.09 above the average for June, 1925.

# Movement of Livestock, July

No features of outstanding importance were shown in the No features of outstanding importance were snown in the receipts and disposition of livestock at public stockyards during the month of July, 1926. Receipts of cattle and calves were 7.6% under the July, 1925, totals, but at the same time were 4.3% greater than the 5-year average for the month. Hog receipts showed a gain of 2% over those for the same month of last year, but were still 15% under the 5-year July average. Sheep and lamb receipts were 2.4% greater than a year earlier, and showed practically the same increase, or 2.5%, when compared with the July average for the five years preceding.

The draggy fat cattle trade apparently had a depressing effect on shipments of stocker and feeder cattle and calves, the figures for July this year being 18.5% smaller than in July, 1925, but were 1.1% above the 5-year average for the month. For the first seven months of the current year, compared with the corresponding period a year earlier, a decrease of 8.2% is shown; and, in fact, this year's totals for the first seven months were smaller than for any corresponding period in the preceding ten years. Most of the decrease occurred in in the picture of the picture in the formation of the detection of the state of the signments, as stocker and feeder calf shipments, considered separately, were 19.6% above those of July, 1925, and 34.3% greater than the 5-year average for the month. Shipments of sheep and lambs also showed large percentage in-erceases in July this year, amounting to 34.5% and 36.6%, respectively, over those for July, 1925, and the 5-year July average. The same was also true of hogs, which registered gains of 38.1% and 74.8%, respectively, although the actual number of head involved was considerably less than that of sheep and lambs sheep and lambs.

### Heavy Stocks Feature Canned-Milk Markets

A month ago reference was made to the light stocks of condensed and evaporated milk in the hands of manufacturers on June 1. The stocks of 153,000,000 pounds on that date were the lowest on record since such information first became available in 1920. Now stocks are again quite heavy, being reported on July 1 as 228,044,731 pounds. This, incidentally, is as high a point as has been reached on that date in any year excepting 1924. It is particularly interesting, in that the increase in stocks this year from June to July was some 74,000,-000 pounds, whereas last year there was, instead, a decrease of 6,000,000 pounds, with production, according to reports now available, showing an increase of only about 5%. Production in July, naturally, has yielded to the influences of hot weather

The current month's figures include reports from condensed and evaporated milk firms operating approximately 97% of the total factories in the United States.

#### Wholesale Prices of Condensed and Evaporated Milk June and May

[To domestic trado]

Ero donteore tradol												
Geographic section	Sweetene densed 14-ound	, case of	Unsweetened evap- orated, case of 16-ounce cans									
	June May		June	May								
New England Middle Atlantic South Atlantic East North Central West North Central South Central Western (north) Western (south)			$\begin{array}{r} \$4.34\\ 4.25\\ 4.36\\ 4.10\\ 4.21\\ 4.45\\ 4.24\\ 4.26\end{array}$	\$4.35 4.23 4.38 4.14 4.25 4.42 4.26 4.31								
United States	6.00	5. 99	4.26	4. 31								

and other unfavorable conditions, and may not compare favorably with that of July, 1925. One of the bases for this thought is that other dairy products, with which the eoncentrated milks must compete for supplies of fluid milk, although showing heavier in June than in June, 1925, were dropping behind last year in July.

The increase in stocks may have been, in part at least, an attempt to lay up supplies against an anticipated light production. If this is the case it can hardly be as significant as such an increase would be otherwise.

Market activity has not been marked during July. In fact trade generally has been slow even in periods of warm weather, which should have stimulated demand for ice cream, and hence improved demand for concentrated milk used for ice-cream making. The market tone has in most instances held steady, although wholesale prices are reported as slightly lower toward the latter part of July, with little, if any, change in prices paid <sup>1</sup>at the condensery.

Foreign trade has been light, but this has occasioned no surprise, as little was expected. Exports in June this year were but little more than half as large as in June, 1925, and the movement was considered moderate at that time. The total for June this year was 10,825,088 pounds and that for June last year was 18,219,368 pounds. Totals of 63,218,663 and 75,-115,695 from the first of the year to June 30 for 1926 and 1925 respectively, indicate that the relative dullness of foreign trade that has prevailed in June also prevailed earlier in the year.

<sup>1</sup> The prices at country points apply to milk delivered direct by farmers in their own cans to local milk shipping stations and near-by city milk plants. They show the range and average of prices actually received by producers supplying citles and differ from the dealers' buying prices by the costs of transportation applicable to different shipping points. The price per 100 pounds may be reduced to price per quart by dividing by 46.53.

Milk cows had the average price of \$67 per head at the farm on July 15. At the same day of the same month in 1925 the average price was \$57,95; in 1924, \$55.46; in 1923, \$56.22; in 1922, \$54.20; in 1921, \$56.55; and in 1920, \$49.

No inspections for export were reported for May from Portland, Me., Boston, Newport News, Norfolk, Galveston, Texas City, or Port Arthur, Tex., No inspections for export were reported for June from Portland, Me. Boston, Newport News, Norfolk, Texas City, Port Arthur, Tex., or Astoria.

# **Recent Agricultural Publications**

The publications are free as long as the limited supply of the department lasts. After the department's supply is exhausted, they may be purchased from the Superintendent of

Documents, Government Printing Office, Washington, D. C., at the prices quoted in parentheses. To obtain the bulletins, list those desired, write your name and address plainly, and send the list to the Office of Informa-tion, Department of Agriculture, Washington, D. C. Requests may be made by postal card or letter.

#### Farmers' Bulletins

- 1480F. Small Concrete Construction on the Farm. (10¢) 1484F. The Clover Leaf Weevil and Its Control. (5¢) 1486F. Longleaf Pine Primer. (5¢) 1487F. Practical Hog Houses. (5¢) 1489F. The Green June Beetle Larva in Tobacco Plant Beds. (5¢) 1493F. Lice, Mange, and Ticks of Horses and Methods of Con-
- trol and Eradication.  $(5\not\epsilon)$ 1497F. Methods and Equipment for Home Laundering.  $(5\not\epsilon)$ 1499F. The Melon Aphid and Its Control.  $(5\not\epsilon)$

#### Department Bulletins

This series of publications is more or less technical and is intended primarily for specialists and research workers. The supply available for free distribution is very limited.

- 1391D. Rayless Goldenrod (Aplopappus Heterophyllus) as a Poisonous Plant, by C. Dwight Marsh and others.  $(5\phi)$
- 1393D. The Granary Weevil, by E. A. Back and R. T. Cotton.
- (10¢)
  1397D. The Pink Bollworm, with Special Reference to Steps Taken by the Department of Agriculture to Prevent Its Establishment in the United States, by W. D. Hunter. (10¢)

- 1408D. Structures Used in Draining Agricultural Land, by L. T. Jessup. (10¢) 1409D. Agricultural Survey of South America: Argentina and

- Paraguay, by Leon M. Estabrook. (20¢)
  1412D. Marketing Lettuce, by Charles W. Hauck. (15¢)
  1415D. Marketing Western Boxed Apples, by George B. Fiske and Raymond R. Pailthorp. (20¢)
  1416D. Marketing Barreled Apples, by George B. Fiske. (20¢)

#### Department Circulars

- 359C. State Forestry Laws of 1922 and 1923, by Jcannie S. Peyton. (10c)372C. Agricultural Investigations at the United States Field
- STAC. Agricultural Investigations at the Onited States Field States Field

- Bavis. (5¢)
  382C. Maple Wilt, by G. F. Gravatt. (5¢)
  383C. The Search in Foreign Countries for Blight-Resistant Chestnuts and Related Tree Crops, by B. T. Gallo-
- way. (5¢) 384C. How to Conduct Milk and Cream Contests, by Ernest Kelly and R. J. Posson.  $(5\phi)$
- 386C. Commercial Control of Pecan Scab, by J. B. Demarce and J. R. Cole. (5¢)
  392C. Rare Cases of Mosaic Diseases in Highly Resistant Varieties of Sugar Cane, by P. A. Yoder. (5¢)

#### Miscellaneous Publications

- Misc. Cir. 63M. The Inspection Stamp as a Guide to Whole-
- some Meat. (5¢) Misc. Cir. 69M. Construction and Operation of Biological Survey Beaver Trap. (5¢) Misc. Cir. 70M. Timely Information About the European Corn
  - Borer. (5¢)

(Continued at bottom of page 267)

Total stocks of cotton all kinds, reported August 6, at the port of New York were 54,785 bales; on August 7, 1925, 51,533 bales; and on August 8, 1924, 74,592 bales. At the port of New Orleans, 145,679 bales; on August 7, 1925, 39,798 bales; and on August 8, 1924, 44,310 bales.

Comparative Cotton Prices for June and July

3

### Cold Storage Report, August 1, 1926

Cold-storage holdings of creamery butter increased during July by 44,212,000 pounds compared with an increase of 45,288,000 pounds in July, 1925. Stocks were approximately 20% higher than they were a year ago and about  $23\frac{1}{2}\%$  higher

25% inglet that they were a year ago and about 25% of inglet than the five-year average. Stocks of American cheese showed an in-movement of 19,510,000 pounds which compares with 20,166,000 for the same period last year. The August 1 holdings exceeded those of the same date last year by 6,945,000 pounds and were 18,339,000 pounds heavier than the five-year average. Total stocks of all varieties of cheese were nearly 6,500,000 pounds over last year over a core way movement into storage.

pounds over last year. Case eggs movement into storage was 701,600 cases compared with 542,000 July, 1925; but the

was 701,600 cases compared with 542,000 July, 1925; but the holdings on August 1 were 190,000 cases short of last year. Holdings of frozen eggs were 51,765,000 pounds. A classification of 80% of this amount shows that 24% were whites; 20% yolks; and 56% mixed. There was a decrease in holdings of frozen poultry of approximately 1,000,000 pounds. Stocks were about the same as the fraction approxact and a poerly 15,000 pounds loss the poerly 1,000 pounds.

five-year average and nearly 18,000,000 pounds less than a year ago.

Stocks of frozen and cured beef were reduced by nearly 3,000,000 pounds and frozen and cured pork holdings increased by slightly over 36,000,000 pounds.

Stocks of lard showed an increase of nearly 32,000,000 pounds and the production during July was 129,225,000 pounds.

### **Review of World Agriculture**

Estimates and forecasts of wheat production to date indicate that the world's supply outside of Russia and China for the year may be about the same as least year. The demand for the new crop wheat, on the other hand, may be stronger than in 1925 because of the low stocks of old wheat, reduced supplies of rye and potatoes, and short wheat crops in the Orient. The estimates and forecasts of production in 21 countries of the Northern Hemisphere reported to date indicate a production of 2,351,000,000 bushels against 2,320,000,000 in 1925. These countries last year produced 78% of the total Northern Hemi-sphere crop, exclusive of Russia and China, and 70% of the estimated world total exclusive of Russia and China. The 1926 outturn of the crops is, of course, still uncertain. The uncertainty of the Cauadian crop is an especially important factor in the situation. Although the final outturn of that crop in the past eight years has averaged about the same as the August forecast, it has ranged from 20% below that figure to 28% above.

Twelve countries reporting to date show a total rye production of 389,900,000 bushels, or 85.5% of the 1925 crop in those countries, which in that year produced 44.6% of the world rye crop outside of Russia. Barley production in 18 countries is put at 822,700,000 bushels which is 91.5% of the 1925 crop. Last year those countries produced 63.5% of the world crop. The production of oats in 16 countries this season is put at 2,332,-000,000 bushels, representing 88.2% of the crop last year in the same countries, which in that year accounted for 65.8%of the estimated world total. Corn is placed at 2,642,000,000 bushels in four countries, or 88.7% of the 1925 figures.

Reports received to date on acreage, growing conditions, and production forecasts indicate that the flaxseed crop of the Northern Hemisphere, excluding Iudia, will probably be as small as or smaller than that of 1925. Production in the United States and Canada, on the basis of August 1 conditions, is foreeast at 25,527,000 bushels, a reduction of 18.5% below the final estimate for 1925, when those two countries produced 20%of the world crop. The new crop in Argentina is just being sown, and the International Institute of Agriculture reports that the area there is expected to be larger than that of last season. The end of the Cuban sugar-grinding season brings the esti-

The end of the Cuban sugar-grinding season brings the estimated world production of beet and cane sugar, raw basis, to 27,138,000 short tons against 26,586,000 short tons for 1924–25, and 22,005,000 short tons, the average for the five seasons 1920–21 to 1924–25. For 1925–26, beet-sugar production is put at 9,022,000 short tons and cane sugar at 18,116,000 short tons. Last season beet-sugar production ran to 8,938,000 short tons and cane to 17,648,000 short tons. Production in Cuba this season is estimated by Guma-Mejer at 5,470,817 short tons, a surplus of 2.6% over the limit set by the erop production law, but 6% under last year's record crop of 5,812,086 short tons. Cotton advices from Egypt continue to reportifavorably on

Cotton advices from Egypt continue to report favorably on the progress of the crop through the middle of July. The condition reported on August 1 was 101% of the average of the past 10 years, compared with 98% for August 1, 1925, as reported by the International Institute of Agriculture. Trade reports from India indicate that up to early July the monsoon had been light and rainfall insufficient, but that those conditions were followed by a strengthening of the monsoon, with rain being reported recently from several sections. Cotton production in Russia for 1926–27 is put at 696,000 bales of 478 pounds as of August 21. That figure is a reduction of 14% from the 1925–26 estimate.

Economie conditions affecting the demand for American agricultural products in Europe are in general not promising for the immediate future, although there are indications of some improvement in the long run. Germany and Poland are the only two important European countries to show definite signs of advancement over the conditions existing a month ago. In Great Britain the coal strike continues to be the principal feature of the economic situation. Fuel shortages have curtailed production in several directions, cotton textiles being an outstanding example. While consumption of staple foodstuffs shows little or no variation from that of better times, the demand for luxuries and semiluxuries, such as fresh fruit, has dropped off materially. All things considered, however, British industrial conditions are still held to be better than they were two months after the coal strike of 1921. Unemployment has remained almost stationary since the end of May, and commodity price indexes have remained stable for the last three months at levels well under those of this time last year, although an upward movement appeared late in July. The weekly average prices of Wiltshire sides at Liverpool, however, showed lower levels in July than in June, a situation expected as the result of the usual fresh pork supplies from the Netherlands arriving or the usual fresh pork supplies from the Netherlands arriving in the form of bacon. For American Wiltshires, the July weekly average reached 23.79 cents per pound against 24.77 cents for June (one week). Canadian Wiltshires dropped to 24.33 centsf against 26.11 cents for June. Danish ranged around 27.50 cents for both months. Receipts of fat pigs at certain Englifh markets made a weekly average of 6,102 head for July against 7.859 in June, while puschases of pigs in Juraleu fell off elightly in July June, while purchases of pigs in Ireland fell off slightly in July to 16,567 from 16,829 for the preceding month.

On August 1 the increased tariff rates on imports of grain into Germany became effective. Financial activity continues brisk in Germany, with strong bidding against foreign offers for industrial stocks, and speculation progressing at a high rate. Plenty of money appears to be available for capital investments, even to the extent of endangering available supplies of working capital. The bankruptcy rate reached only 147 for the third week in July, or only one-third of the rate prevailing in February, 1926. It is felt that by this time most of the "mushroom" firms of the inflation period have been forced out. Coal mining, steel and textiles show an increased activity over the preceding month. The weekly average prices of fat hogs at Berlin rose slightly during July to 16.61 cents per pound against 16.24 cents for the June average. The July averages for lard in tierces at Hamburg, however, declined to 18.42 cents from 18.83 cents for the preceding month. Receipts of hogs during July at 14 important markets made a weekly average for July of 42,808 head against 44,852 head weekly during June.

In Czechoslovakia the stock market has been stagnant, with industrial shares at low levels. Higher prices on meat and cereals have resulted from the imposition of the new import The sugar market reports slow business through overtariffs. production, with stocks considerably higher than last year. Most of the Czech beet-sugar exports go to Great Britain. Polish foreign exchange has been showing unusual strength and the stock exchange is reported as active. Coal exports have increased, as have preharvest exports of agricultural products. Movements of grains are unusual at this time of year and are attributed to the release by speculators of supplies held for higher prices. The favorable situation in Poland contributes to the revival of the textile industry noticeable during the last two months. Italy continues to urge the reduction of imported foodstuffs, and Denmark still complains of the depressing effects of deflation. In Belgium improved conditions are expected since the Crown has been given wide powers for fiscal reform.

#### The Price Situation

Farm prices and income.—The general level of farm prices declined four points from 139 on June 15 to 135 on July 15. Lower prices of cotton, wheat, potatoes, hogs, sheep, and lambs contributed most to the decline. At 135, the index is approximately 10% below that of July, 1925. Since July 15, declines have been registered in the market prices of wheat, cotton, potatoes, and hogs, while the prices of corn, oats, and butter have increased.

During the past 16 years there have been eight instances when the index declined between June and July, and in six of these eight years the index continued to lower levels for the remainder of the calendar year. The two exceptions were 1917, a war year, and 1923, when the index was affected by a rise in cotton prices as a result of successive short crops.

a var year, and roots, when the inclusion was indeceed as cotton prices as a result of successive short crops. Business conditions.—The maintenance of a high level of business activity during July above the relatively high level of June indicates a recovery of business conditions from the temporary recession of the late spring. The high degree of activity was maintained in spite of a continued decline in the general price level; but this decline between June and July was due largely to lower prices of farm products, the general level of nonagricultural prices remaining unchanged partly as a result of recent curtailment in certain lines of manufacturing activity. Fisher's weekly index numbers showed a continued steady decline from a temporary peak of 150.8 for the week ended July 9, the figure for the week ended August 6 being 147.7.

Perceptible improvements were noted in the cotton textile and leather trades. Sales of the two leading mail order houses averaged 15% larger than in July of last year. The summer slaekening which is normally expected in many lines of business is not as great as usual. The retail purchasing of goods is proceeding at a relatively high level, due to good wages, steady employment, and the influence of installment buying. Money rates continue low, their slight advance during July being less than the usual seasonal increase.

Security prices continued to advance during July, being aided by the easy credit facilities, and by the end of the month had not only recovered from the temporary effects of the decline in the French franc, but had reached approximately the high levels that prevailed in February before the March decline.

Wheat.—The feature of the wheat market which was of outstanding interest to producers during July was a marked rise in the price of cash wheat at Minneapolis, while prices at the principal winter wheat markets declined materially. In part, the rise at Minneapolis was a reflection of the immediate cash wheat situation, but the apparent establishment of spring wheat prices between 20 and 30 cents above the prices of winter wheat is largely the effect of a material difference in the prospects for the winter and spring wheat crops. While almost record yields are reported from Kansas and neighboring States producing hard winter wheat, the spring wheat crop has suffered seriously from drought and hot weather, and a short crop is expected.

Under these conditions it is not unlikely that during a large part of the crop season spring wheat will sell on a domestic basis, while the export market will determine the price of hard winter wheat. The average price of No. 1 Northern spring wheat at Minneapolis for the week ended July 30, at \$1.64, was 28 cents above the price of No. 2 Hard Winter wheat at Kansas City, compared with 7 cents above for the corresponding week last year.

During the past 16 years, an average of 16.3% of the United States wheat crop has been marketed in September. Exports from surplus producing countries outside the United States are normally at a minimum during this month, while the United States goes onto the world market with the largest exports of the year. This distribution of world exports may be a factor in stabilizing prices during our heavy marketing period. Dur-ing the past 32 years the September price of winter wheat (No. 2 Hard Winter at Kansas City) was higher than the August

price 15 times, unchanged once, and lower 16 times. With the outturn of the wheat crop in the United States fairly well known, the movement of the prices during the next few months will to a large extent depend upon the outturn of the crops in other countries, particularly in Canada. The size of the crops and the demand for wheat in Europe, the possibility of an export surplus from Russia, and the development of the crop in the Southern Hemisphere may be expected to influence the market.

The outturn of the Canadian crop is still uncertain. The official estimate as of August 1 places it at 317,000,000 bushels, which is 94,000,000 less than the estimated crop of last year. Forecasts of production from countries reporting to date, which in 1925 produced 77% of the total Northern Hemisphero crop, indicate a wheat crop for the Northern Hemisphere about the same as last year, though lower condition reports from other important European countries indicate smaller crops, which may reduce the total to less than last year's production. The outturn of the Russian crop, however, remains uncertain, and may become an important factor in the price situation. Reports indicate a somewhat larger acreage in Russia, and crop conditions about the same as last year. The planting of wheat in the Southern Hemisphere has been progressing under favorable circumstances.

Cotton .- The outstanding feature of the textile market during July was the revival of activity in the domestic mills, accompanied by the increased use of low-grade cotton from the present heavy stocks. The supply situation remains unchanged for raw cotton, with a very large carryover and a prospective large crop; but in the cotton goods market abroad there are indications that manufacturing activity has been lagging behind consumer buying, and that stocks of finished goods are being reduced. Little change has taken place in the foreign situation, and the im-mediate foreign outlook is not bright. In England no appreciable improvement is expected until the coal strike is settled. The prices of raw cotton, as is usual at this time of the year, continue to fluctuate on weather and condition reports.

Hogs.-The movement of hogs to market continued to run low during July, receipts at 12 markets for the four weeks from July 5 to July 31 averaging 4% below the average weekly re-ceipts during June and just barely below those of July last year. Under the continued stimulus of unusually favorable price relations, however, hog weights showed even more than the usual summer gain. At Chicago the average weight for the month, 272 pounds, was 22 pounds above the average for last July and more than 30 pounds above the usual weight for the month.

With the continued large proportion of heavy-weight hogs, prices weakened materially, especially on medium and heavy hogs and on packing sows. By the end of the month the margin between light-weight and heavy-weight hogs had nearly doubled. While the price of heavy hogs for the last four weeks averaged of cents below the corresponding figure for June and 64 cents below the average for the same period last year, the increasing proportion of the cheaper weights reduced the average cost to packers and shippers (at Chicago) to \$12.59, or \$1.39 lower than for June.

Provision markets meanwhile were rather erratic. Hams and bacon were maintained at prices well above those of last year, though showing some weakness toward the close of the month, while lard was weak and declined to below the 1925 level. Most fresh cuts were also rather weak.

In spite of the relatively weak immediate situation, the general outlook for hog prices is favorable. Storage stocks continue unusually low, and at the same time the marketings for the rest of the summer, as indicated by the pig survey, will be little if any larger than last summer. While the summer weather may be expected to have the usual effect upon consumer demand for meat, no slackening of business activity is yet in sight, and domestic demand during the next few months will apparently continue at least as high as a year ago. With these conditions, and the indicated short supplies, it does not seem likely that hog prices will continue to slump much further, or that they will remain at the low point reached at the end of the decline.

Lambs.—The midsummer sheep and wool outlook, published elsewhere in this issue, indicates that if the prospective increase in the lamb crop should result in a 10% increase in lamb slaughter, a reduction of 6%-10% in the average price of slaughter lambs during the next 12 months below the average of the last 12 months would be in line with previous experience, considering the present demand outlook. (Refer to p. 251.)

Butter.-Contrary to the usual slight seasonal increase, butter prices during July averaged over half a cent below those of June, and about three cents below those of last July. This continued weakness occurred in spite of receipts for the four weeks ended July 31 averaging nearly 9% below the corresponding weekly average in June, and 4.5% below the weekly average for July of last year.

In spite of the slight decrease in receipts, storage stocks continued to pile up faster than a year ago, the figures for August I indicating a net into-storage movement during July of 10% greater than in July of last year. These stocks are about one-third greater than usual for this date during recent years, and are even slightly in excess of the previous record holdings in 1924.

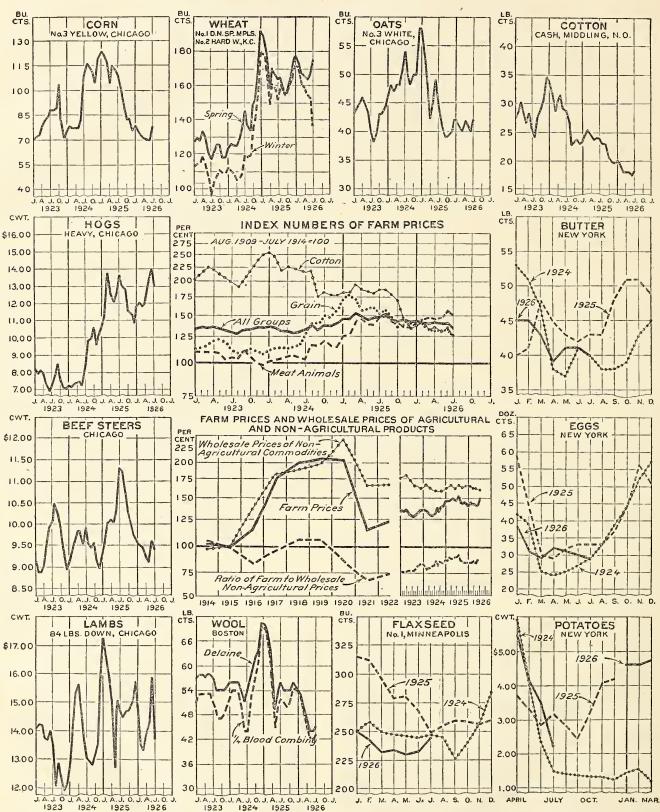

In contrast to the domestic situation, the foreign market has been quite strong, rather unfavorable weather conditions in the Southern Hemisphere coinciding with an unexpectedly strong demand from Germany and the United Kingdom, both of which apparently have been consuming greater quantities than a year ago. Should this improved demand continue through the winter it may do much to strengthen the domestic situation. New York prices at the end of July were only about three cents above Copenhagen, however, so it would appear that the foreign situation is likely to have no direct effect upon the domestic market for some months.

The trend of prices during the next few months will depend largely upon whether production falls off enough to compensate for the heavy stocks in storage. Even if production during The balance of the season should be as heavy as a year ago, an increase of but 4% in consumption during the six months from November through April would be sufficient to wipe out the surplus above last year. During 1924, when there were similar heavy stocks, largely due to continued heavy late summer production, butter prices failed to show the usual seasonal increase through the late summer and early fall, yet rose during the following winter and spring to substantially thelevels of the 1923-24 season. The weighted average pasture condi-tion on August 1 for the eight most important butter States was 64.4% of normal, which is 3.5 points below the lowest previous August 1 condition in the past seven years, that of 1921, and 9 points below the condition on August 1 last year.

<sup>1</sup> Computed for the Bureau of Agricultural Economies by the Bureau of Labor Statistics from wholesale prices of all commodities other than those originating on United States farms. 1910-1914=100. <sup>1</sup> Index numbers of all groups of farm prices divided by the index numbers of wholesale prices of nonagricultural commodities.

Price Movements of Important Agricultural Products

This set of charts is an attempt to show at a glance the price situation of agricultural products. The individual charts forming the border display prices which are considered to be fairly typical of the market price movements of the major agricultural products. The upper chart in the center shows the movement of prices of 30 farm products, and of the grain, meat animals, and cotton groups for comparison. The lower center chart shows the movement of farm and wholesale prices of agricultural products, wholesale prices of nonagricultural products, and the ratio of farm prices to wholesale prices of nonagricultural commodities.
